

# Dynamic Monitoring Built for Next-Generation Networks

Gain control of your network with a unified intelligent approach to monitoring from IBM SevOne Network Performance Management.

## Network performance monitoring has never been easy.

It has become increasingly more difficult as the complexity of network and application infrastructure has soared through digital transformation.

**66%**

of the alerts produced by network monitoring tools are not actionable

**31%**

of all IT service problems are reactive and reported by end users

**27%**

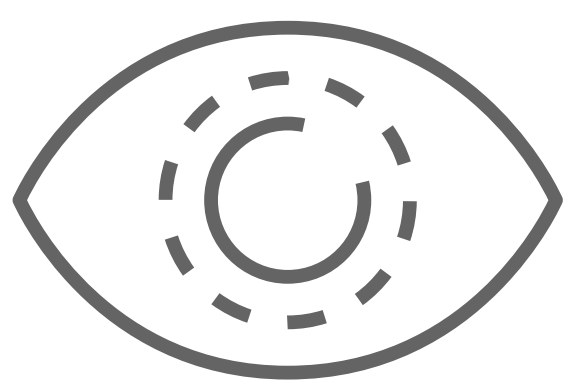

of all network-related problems are caused by manual administrative tasks

The complexity of modern networks has inhibited full visibility and created a large amount of performance data, making it difficult to locate and address network service issues early, before they become costly problems.<sup>1</sup>

## Proactively monitor multivendor networks across enterprise, communication, and MSPs with real-time, actionable insights.

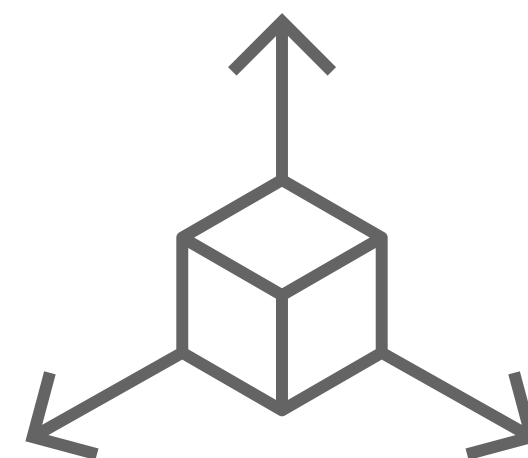

Designed for modern networks, IBM SevOne Network Performance Management helps you spot, address, and prevent network performance issues early with machine learning-powered analytics.

### UNLEASH THE FULL POTENTIAL OF YOUR NETWORK INFRASTRUCTURE:

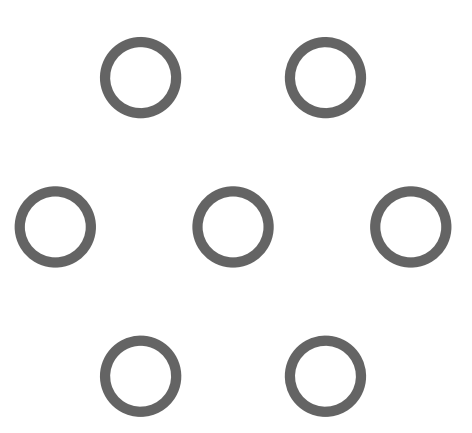

#### GO BEYOND DETECTION

Surface the insights that matter most and avoid costly performance issues

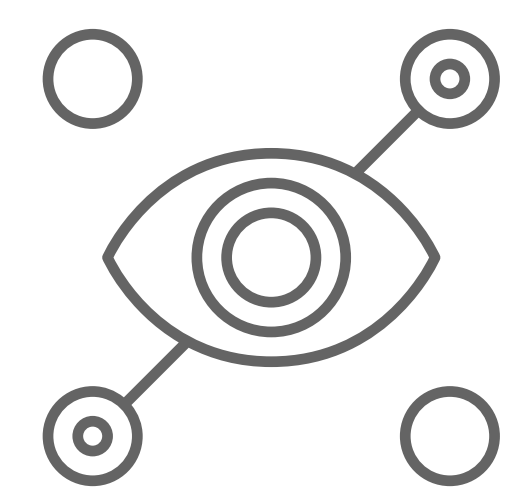

#### SCALE WITH SPEED AND ACCURACY

Drive network performance at scale with no reduction in quality

#### ENABLE NEXT-GEN NETWORKS

Evolve to software-defined, 5G and edge multicloud networks

#### GAIN A FULL VIEW

Enhance visibility to monitor SDN, SD-WAN and wifi networks across all environments

Going beyond detection, IBM SevOne Network Performance Management combines industry-leading expertise and advanced technologies to help your IT team act on what matters: improving network performance to provide exceptional user experience.

Address the growing complexity of network performance monitoring with advanced capabilities that deliver visibility, insight, and action.
